Foliations: Unraveling the Layers of Manifolds

Foliations are ubiquitous in differential geometry, describing a special type of decomposition of a manifold into a stack of lower-dimensional submanifolds called leaves. Imagine peeling an onion layer by layer, revealing the intricate structure beneath its surface. Foliations provide a powerful tool to study the geometry of complex manifolds.

Lie Groupoids: Connecting Lie Groups and Manifolds

Lie groupoids, a generalization of Lie groups, play a pivotal role in bridging the gap between Lie groups and manifolds. They are a natural framework for studying symmetries and transformations in differential geometry and mathematical physics.
